1. FIVE IMPORTANT ASSETS

1. **Employee Email Accounts** – Email is important for communication with customers, suppliers, and employees. Compromised email accounts could expose sensitive business information and allow attackers to send fraudulent messages.
2. **Shared Computers** – The company uses shared computers for daily work. These computers may contain business documents, saved passwords, and access to other company systems.
3. **Company Website** – The website represents BrightLayer Stores online and may provide information about the business and its products. If compromised, it could damage the company's reputation and affect customer trust.
4. **Cloud Storage with Invoices** – Cloud storage contains invoices and potentially sensitive financial and customer information. Loss or unauthorized access could cause financial and privacy problems.
5. **User Passwords** – Passwords protect employee accounts and company systems. Weak or reused passwords could allow attackers to gain unauthorized access to multiple resources.

2. THREE POTENTIAL THREATS

1. **Cybercriminal / Phishing Attacker** – An attacker may send fake emails to employees to steal usernames and passwords.
2. **Malware or Ransomware** – Malicious software could infect a shared computer through a harmful attachment, download, or website.
3. **Unauthorized Person on Public Wi-Fi** – An attacker connected to or monitoring the public Wi-Fi could attempt to intercept traffic or access poorly protected devices.

3. THREE VULNERABILITIES

1. **Weak or Reused Passwords** – Employees may use simple passwords or reuse the same password across multiple accounts.
2. **Insufficient Security on Shared Computers** – Shared computers may lack separate user accounts, strong access controls, updated software, or endpoint protection.
3. **Poorly Secured Public Wi-Fi** – The public Wi-Fi router may use weak security settings, outdated firmware, or an easily guessable administrator password.

4. ASSOCIATED RISKS

1. **Phishing + Weak/Reused Passwords → Account Compromise**
   If an employee enters a reused password into a phishing website, an attacker could access the employee's email and potentially other company services. This could result in data theft, fraudulent emails, and financial loss.

2. **Malware/Ransomware + Insecure Shared Computers → Data Loss and Business Disruption**
   Malware could infect a shared computer and spread to accessible files or cloud services. Ransomware could make important files unavailable and interrupt normal business operations.

3. **Unauthorized Wi-Fi Attacker + Poorly Secured Public Wi-Fi → Unauthorized Network Access**
   An attacker exploiting weak Wi-Fi security could gain access to network resources or intercept poorly protected communications. This could expose business information and customer data.

5. SECURITY RECOMMENDATIONS

1. **Enable Multi-Factor Authentication (MFA)** for employee email and cloud storage to reduce the impact of stolen passwords. This addresses the phishing/password risk.

2. **Use strong, unique passwords** for every account and provide employees with a password manager. This reduces the risk of password reuse and account compromise.

3. **Create separate user accounts on shared computers** and apply least-privilege access. This limits the damage if one account or computer is compromised.

4. **Install endpoint protection and regularly update operating systems and software** on all shared computers. This reduces the risk of malware and ransomware.

5. **Secure the Wi-Fi router** using strong Wi-Fi encryption, a strong administrator password, and regular firmware updates. This reduces the risk of unauthorized network access.

6. **Provide basic phishing and cybersecurity awareness training** to all eight employees. Employees should learn how to identify suspicious links, attachments, and login requests.

7. **Back up important invoices and business data regularly** and keep backups protected from ransomware. This helps the company recover from data loss or a cyberattack.
